

# ChatScript System Variables and Engine-defined Concepts

Copyright Bruce Wilcox, gowilcox@gmail.com www.brilligunderstanding.com  
Revision 6/13/2022 cs13.2

- Engine-defined Concepts
- System Variables
- Control over Input
- Interchange Variables

## Engine-defined concepts

In addition to concepts defined in script files, the system automatically defines a bunch of dictionary-based sets as well as dynamically computed concept members.

set	description
~web_url	word is a web url
~email_url	word is an email address
~kindergarten	word learned early in life
~grade1_2	word learned in these grades
~grade3_4	word learned in these grades
~grade_5-6	word learned in these grades.
	Unmarked words are learned even later
~utf8	word has nonascii characters
~daynumber	word could be a number of a day in a month
~yearnumber	word could be the number of a recent year
~dateinfo	phrase is month day year of some kind
~kelvin	temperature marker
~celcius	temperature marker
~fahrenheit	temperature marker
~twitter_name	twitter user name
~hashtag_label	twitter topic reference

## Interjections, “discourse acts”, and concept sets

Some words and phrases have interpretations based on whether they are at sentence start or not. E.g., *good day*, *mate* and *It is a good day* are different for *good day*.

Likewise *sure* and *I am sure* are different.

Words that have a different meaning at the start of a sentence are commonly called interjections.

In ChatScript these are defined by the `livedata/interjections.txt` file. In addition, the file augments this concept with “discourse acts”, phrases that are like an interjection. All interjections and discourse acts map to concept sets, which come thru as the user input instead of what they wrote.

For example *yes* and *sure* and *of course* are all treated as meaning the discourse act of agreement in the interjections file. So you don’t see *yes, I will go* coming out of the engine.

The interjections file will remap that to the sentence `~yes`, breaking off that into its own sentence, followed by *I will go* as a new sentence.

These generic interjections (which are open to author control via `interjections.txt`) are:

interjection	description
<code>~yes</code>	
<code>~no</code>	
<code>~emomaybe</code>	
<code>~emohello</code>	
<code>~emogoodbye</code>	
<code>~emohowzit</code>	
<code>~emothanks</code>	
<code>~emolaugh</code>	
<code>~emohappy</code>	
<code>~emosad</code>	
<code>~emosurprise</code>	
<code>~emomisunderstand</code>	
<code>~emoskeptic</code>	
<code>~emoignorance</code>	
<code>~emobeg</code>	
<code>~emobored</code>	
<code>~emopain</code>	
<code>~emoangry</code>	
<code>~emocurse</code>	
<code>~emodisgust</code>	
<code>~emoprotest</code>	
<code>~emoapology</code>	
<code>~emomutual</code>	

Because all interjections at the start of a sentence are broken off into their own sentence, this kind of pattern does not work:

u: (~yes \_\*)

You cannot capture the rest of the sentence here, because it will be part of the next sentence instead. This means interjections act somewhat differently from other concepts.

If you use a word in a pattern which may get remapped on input, the script compiler will issue a warning. Likely you should use the remapped name instead.

The following concepts are triggered by exactly repeating either the chatbot or oneself (to a repeat count of how often repeated). Repeats are within a recency window of about 20 volleys.

concept	description
~repeatme	
~repeatinput1	
~repeatinput2	
~repeatinput3	
~repeatinput4	
~repeatinput5	
~repeatinput6	

## POS (Part of Speech) Tags

Words will have pos-tags attached, specifying both generic and specific tag attributes, eg., ~noun, ~noun\_singular.

### Generic Specifics

nouns	description
~noun	
~noun_singular	
~noun_plural	
~noun_proper_singular	
~noun_proper_plural	
~noun_gerund	
~noun_number	
~noun_infinitive	
~noun_omitted_adjective	

verbs	description
~verb	
~verb_present	

verbs	description
~verb_present_3ps	
~verb_infinitive	
~verb_present_participle	
~verb_past	
~verb_past_participle	
~aux_verb	
~aux_verb_present	
~aux_verb_past	
~aux_verb_future	
~aux_verb_tenses	
~aux_be	
~aux_have	
~aux_do	

Auxilliary verbs are segmented into normal ones and special ones. Normal ones give their tense directly. Special ones give their root word. The tense of the be/have/do verbs can be had via `~properties()` and testing for verb tenses

adjectives	description
~adjective	
~adjective_normal	
~adjective_number	
~adjective_noun	
~adjective_participle	

adjectives in comparative form	description
~more_form~most_form	
~adverb	
~adverb_normal	

adverbs in comparative form	description
~more_form~most_form	
~pronoun~pronoun_subject~pronoun_object	
~conjunction_bits~conjunction_coordinate~conjunction_subordinate	
~determiner_bits~determiner~pronoun_possessive~predeterminer	
~possessive	covers ' and 's at end of word
~to_infinitive	“to” when used before a noun
~preposition~particle	free-floating preposition tied to

adverbs in comparative form	description
~comma	
~quote	covers ' and __“__ when not en
~paren	covers opening and closing par
~foreign_word	some unknown word
~there_existential	the word there used existentia

In addition to normal generic kinds of pos tags, words which are serving a pos-tag role different from their putative word type are marked as members of the major tag they act as part of. E.g,

	description
~noun_gerund	verb used as a ~noun
~noun_infinitive	verb used as a ~noun
~noun_omitted_adjective	an adjective used as a collective noun (eg <i>the beautiful are kind</i> )
~adjectival_noun	noun used as adjective like bank “bank teller”
~adjective_participle	verb participle used as an adjective

For ~noun\_gerund in *I like swimming* the verb gerund *swimming* is treated as a noun (hence called noun-gerund) but retains verb sense when matching keywords tagged with part-of-speech (i.e., it would match **swim~v** as well as **swim~n**).

Additionally, there is

	description
<code>~number</code>	is not a part of speech, but is comprise of <code>~noun_number</code> (a normal number value like <i>17</i> or <i>seventeen</i> )
<code>~adjective_number</code>	also a normal numeral value and also <code>~placenumbers</code> like <i>first</i> .
<code>~integer</code>	
<code>~float</code>	
<code>~positiveinteger</code>	
<code>~negativeinteger</code>	
<code>~modelnumber</code>	not a true number, but a word with both alpha and numeric
<code>~filename</code>	looks like a filename with extension
<code>~modelnumber</code>	not a true number, but a word with both alpha and numeric
<code>~prep_phrase</code>	chunk of text forming a prepositional phrase
<code>~verb_phrase</code>	chunk of text forming a verb phrase
<code>~noun_phrase</code>	chunk of text forming a noun phrase

“To” can be a preposition or it can be special. When used in the infinitive phrase To go, it is marked `~to_infinitive` and is followed by `~noun_infinitive`.

	description
~verb_infinitive	refers to a match on the infinitive form of the verb ( <i>I hear John sing</i> or <i>I will sing</i> ).
~There_existential	refers to the use of where not involving location, meaning the existence of, as in <i>There is no future</i> .
~Particle	refers to a preposition piece of a compound verb idiom which allows being separated from the verb. If you say <i>I will call off the meeting</i> , <i>call_off</i> is the composite verb and is a single token. But if you split it as in <i>I will call the meeting off</i> , then there are two tokens. The original form of the verb will be <i>call</i> and the canonical form of the verb will be <i>call_off</i> , while the free-standing <i>off</i> will be labeled ~particle.

	description
~verb_present	will be used for normal present verbs not in third person singular like <i>I walk</i> and
~verb_present_3ps	will be used for things like <i>he walks</i>
~possessive	refers to 's and ' that indicate possession, while possessive pronouns get their own labeling ~pronoun_possessive.
~pronoun_subject	is a pronoun used as a subject (like <i>he</i> )
~pronoun_object	refers to objective form like <i>him</i>

Individual words serve roles in the parse of a sentence, which are retrievable. These include:

	description
~mainsubject	
~mainverb	
~mainindirect	
~maindirect	
~subject2	
~verb2	
~indirectobject2	
~object2	
~subject_complement	adjective object of sentence involving linking verb

	description
~object_complement	2ndary noun or infinitive verb filling modifying mainobject or object2
~conjunct_noun~conjunct_verb~conjunct_adjective~conjunct_adverb~conjunct_phrase	
~postnominalAdjective	adjective occurring AFTER the noun it modified
~reflexive	reflexive pronouns
~not	
~address	noun used as addressee of sentence
~appositive	noun restating and modifying prior noun
~absolutephrase	special phrase describing whole sentence
~omittedtimeprep	modified time word used as phrase but lacking preposition ( <i>Next tuesday I will go</i> )
~phrase	a prepositional phrase start (except
~clause	a subordinate clause start
~verbal	a verb phrase

and special concepts: | ~capacronym | word is in all caps (and &) and is likely  
an acronym | ~emoji | word starts and end with : and represents an emoji

## Spanish

For Spanish (if you are in spanish language mode) there is `~spanish_he`, `~spanish_she`, `~spanish_singular`, `~spanish_plural` for nouns and adjectives and determiner ‘the’. Pronouns will be marked with `~pronoun_object_singular` or `~pronoun_object_plural` or `~pronoun_object_you`. Also `~pronoun_indirectobject_singular` and `~pronoun_indirectobject_plural` and `~pronoun_indirectobject_you`. Also `~pronoun_I` and `~pronoun_you`. And simple future tense verbs will be marked `~spanish_future`.

## System Variables

The system has some predefined variables which you can generally test and use but not normally assign to. These all begin with `%`. Ones that are reasonable to set are written in bold underline. Boolean values are always `1` or `null` on returns. `1` or `0` if you are setting them.

## Date & Time & Numbers

variable	description
<code>%date</code>	one or two digit day of the month
<code>%day</code>	Sunday, etc
<code>%daynumber</code>	1-7 where 1 = Sunday
<code>%fulltime</code>	seconds representing the current time and date (Unix epoch time)
<code>%fullmtime</code>	Numeric full time/date in milliseconds (Unix epoch time)
<code>%hour</code>	0-23
<code>%timenumber</code>	completely consistent full time info in numbers that you can do <code>_0 = ~burst(%timenumber)</code> to get <code>_0</code> =seconds (2digit) <code>_1</code> =minutes (2digit) <code>_2</code> =hours (2digit) <code>_3</code> =dayinweek(0-6 Sunday=0) <code>_4</code> =dateinmonth (1-31) <code>_5</code> =month(0-11 January=0) <code>_6</code> =year. You need to get it simultaneously if you want to do accurate things with current time, since retrieving <code>%hour</code> <code>%minute</code> separately allows time to change between calls
<code>%leapyear</code>	boolean if current year is a leap year
<code>%daylightsavings</code>	boolean if current within daylight savings
<code>%minute</code>	0-59
<code>%month</code>	1-12 (January = 1)
<code>%monthname</code>	January, etc
<code>%second</code>	0-59

variable	description
<code>%volleytime</code>	number of seconds of computation since volley input started
<code>%time</code>	hh:mm in military 24-hour time
<code>%zulu</code>	2016-07-27T11:38:35.253Z
<code>%week</code>	1-5 (week of the month)
<code>%year</code>	e.g., 2011
<code>%rand</code>	get a random number from 1 to 100 inclusive

Time and date information are normally local, relative to the system clock of the machine CS is running on. See `$cs_utcoffset` for adjusting time based on relationship to utc (e.g your server is in Virginia and you are in Colorado).

`%rand` is only pseudo-random. A specific username is assigned a seed based on their name. Thereafter the seed evolves by the dialog but it is repeatable when the same user starts over again. If you want truly random, use `%fullmstime %Showmany` to get range 0 .. `%Showmany-1`

## User Input

variable	description
<code>%bot</code>	current bot responding
<code>%revisedinput</code>	Boolean is current input from <code>^input</code> not direct from user
<code>%command</code>	Boolean was the user input a command

variable	description
%foreign	Boolean is bulk of the sen- tence com- posed of foreign words
%impliedyou	Boolean was the user input having you as implied subject
%impliedsubject	Boolean was the user input having an implied subject (not you, usually I)
%input	the count of the number of volleys this user has made ever

variable	description
%volley	sae as %input, the count of the number of volleys this user has made ever
%ip	ip address supplied
%myip	ip address of cs server responding
%language	current dictio- nary language
%length	the length in tokens of the current sentence
%more	Boolean is there another sen- tence after this

variable	description
%morequestion	Boolean is there a ? or ques- tion word in the pend- ing sentences
%originalinput	all sen- tences user passed into volley, before ad- justed in any way except OOB data is stripped off
%originalsentence	the current sen- tence after to- keniza- tion but before any adjustments
%parsed	Boolean was current input parsed successfully

variable	description
<code>%question</code>	Boolean was the user input a ques- tion - same as ? in a pattern
<code>%quotation</code>	Boolean is current input a quotation
<code>%sentence</code>	Boolean does it seem like a sen- tence (sub- ject/verb or command)
<code>%tableinput</code>	current line being exe- cuted in a table expan- sion during script compilation

variable	description
<b>%tense</b>	past , present, or future simple tense (present perfect is a past tense)
<b>%user</b>	user login name supplied
<b>%userfirstline</b>	value of <b>%input</b> that is at the start of this conver- sation start
<b>%speaker</b>	value of <b>speaker</b> from a conver- sation involv- ing :tsvsource
<b>%userinput</b>	Boolean is the current input from the user (vs the chatbot)

variable	description
<code>%voice</code>	active or passive on current input
<code>%trace_on</code>	Fake empty variable used to turn on tracing (see De- bugging commands)
<code>%trace_off</code>	Fake empty variable used to turn off tracing (see De- bugging commands)
<code>%starttimems</code>	Start of user request time/date in milliseconds
<code>%inputsize</code>	gives how many charac- ters were passed in input

variable	description
%inputlimited	1 if too many characters were given (relative to fullinputlimit)
%tsvsource	1 if in progress Null otherwise
%heapsize	how many bytes of heap are left

## Chatbot Output

variable	description
%inputrejoiniter	index of any pending rejoinder for input or null if none pending
%lastoutput	the text of the last generated response for the current volley - always null across volleys
%lastquest	Boolean did last output end in a ?

variable	description
<b>%outputrejoinder</b>	boolean if system set a rejoinder for its current output or 0
<b>%response</b>	number of committed responses that have been generated for this sentence (see Advanced User-Advanced Output: Committed Responses)

## System variables

Note for all time variables, they normally use local machine time. If you have a \$cs\_utcoffset variable with a value, then all time will be relative to GMT/UTC/Zulu (which means it doesn't pay attention to daylight savings and you have to do that yourself with the answer).

variable	description
<b>%all</b>	Boolean is the :all flag on? (:all to set)
<b>%document</b>	Boolean is :document running
<b>%fact</b>	Numeric value most recent fact id

variable	description
<b>%freetext</b>	kb of avail- able text space
<b>%freedict</b>	number of unused dictio- nary words
<b>%freefact</b>	number of unused facts
<b>%maxmatchvariables</b>	number of match vari- ables, cur- rently 20
<b>%maxfactsets</b>	highest number of @fact- sets, cur- rently 20
<b>%host</b>	name of the current host ma- chine or “local”
<b>%regression</b>	Boolean is the regres- sion flag on

variable	description
<b>%server</b>	Boolean is the system running in server mode
<b>%rule</b>	get a tag to the current execut- ing rule. Can be used in place of a label

variable	description
%topic	name of the current “real” topic . if control is currently in a topic or called from a topic which is not system or nostay, then that is the topic. Otherwise the most recent pending topic is found
%actualtopic	literally the current topic being processed (system or not)

variable	description
<b>%trace</b>	Numeric value of the trace flag (:trace to set)
<b>%httpresponse</b>	return code of most recent ^jsonopen call (see below)
<b>%pid</b>	Linux process id or 0 for other systems
<b>%restart</b>	You can set and retrieve a value here across a system restart.
<b>%timeout</b>	Boolean tells if a timeout has happened, based on the time-limit command line parameter

variable	description
%lastcurltime	Time
%analyticname	Analy- sis: Name
%lookup:	Look up:
%hostproxy	Host/proxy
%connect:	con- nect:
%appssl	App(SSL)
%connect:	con- nect:
%pretransfer:	Pre- trans- fer:
%totaltransfer:	Total Transfer:
%crosstalk4k	4k buffer in server visible be- tween users to pass data back and forth
%crosstalk1k	1k buffer in server visible be- tween users to pass data back and forth

variable	description
<code>%crosstalk2k</code>	buffer in server visible be- tween users to pass data back and forth
<code>%crosstalk3k</code>	buffer in server visible be- tween users to pass data back and forth
<code>%logging</code>	bit status of server- Log, user- Log, and host name - 0=off 1=file 2= stdout 4=stderr 8=prelog)

variable	description
<b>%forkcount</b>	number of forks re- quested in linux evserver environment
<b>%dbparams</b>	copy of the server params given to db used as file- server (pg or mysql or mssql or mongo)
<b>%botid</b>	bot id number in use
<b>%curlversion</b>	curl version information
<b>%dbversion</b>	db version information
<b>%testpattern</b>	The index number in the array of pat- terns of current pattern being matched in ^testpattern

%httpresponse returns the official http response codes when it succeeds in connecting to a server. When it fails, it returns various negative codes that are specific to curl.

- 1 timeout - connection attempt was canceled or no time was allowed (instant fail)
- 2 couldn't connect or not resolve host or proxy
- 3 unsupported protocol
- 4 curl got nothing (typically sent http to https site)
- 5 malformed url
- 6 other
- 7 curl operation timeout

## ^testpattern control variables

%testpattern-prescan | execute this pattern on all sentences before doing other patterns one-by-one

%trace\_on | starting here, do :trace pattern in ^testpattern

%trace\_on all | starting here, do :trace all in ^testpattern

%trace\_off | turn off tracing (also turns off at end of cs call)

## Build data

variable	description
%dict	date/time the dictionary was built
%engine	date/time the engine was compiled
%os	os involved (linux windows mac ios)
%script	date/time build1 was compiled
%version	engine version number

You actually can assign to any of them. This will override them and make them return what you tell them to and is a particularly BAD thing to do if this is running on a server since it affects all users (unless you reset the variable at the end of the volley. Assigning a period to a variable resets it).

Typically one does this as a temporary assignment in a `#!` comment line to set up conditions for testing using `:verify`.

Making them return a new value is NOT the same thing as making the engine have a different value. Unless the variable is marked as settable, setting a value affects only the value returned by a future call to the system variable. It does not change engine values the variable is meant to reflect.

## Control Over Input

The system can do a number of standard processing on user input, including spell correction, proper-name merging, expanding contractions etc. This is managed

by setting the user variable `$cs_token`.

The default `$cs_token` that comes with Harry is:

```
$cs_token = #DO_INTERJECTION_SPLITTING |  
            #DO_SUBSTITUTE_SYSTEM |  
            #DO_NUMBER_MERGE |  
            #DO_PROPERNAME_MERGE |  
            #DO_SPELLCHECK |  
            #DO_PARSE
```

The `#`signals a named constant from the `dictionarySystem.h` file. One can set the following:

These enable various LIVEDATA files to perform substitutions on input:

flag	description
#DO_ESSENTIALS	perform LIVEDATA/systemessentials which mostly strips off trailing punctuation and sets corresponding flags instead
#DO_SUBSTITUTES	perform LIVEDATA/substitutes
#DO_CONTRACTIONS	perform LIVEDATA/contractions, expanding contractions
#DO_INTERJECTIONS	perform LIVEDATA/interjections, changing phrases to interjections
#DO_BRITISH	perform LIVEDATA/british, respelling brit words to American
#DO_SPELLING	performs the LIVEDATA/spelling file (manual spell correction)
#DO_TEXTING	performs the LIVEDATA/texting file (expand texting notation)
#DO_SUBSTITUTE_SYSTEM	do all LIVEDATA file expansions

The contents of the files above are pairs of tokens per line. Left is the word to replace and right is the replacement. When multiple words are involved, the left side uses underscores to represent this and the right side uses `+`. If the right side is missing, it means just delete. | `#DO_INTERJECTION_SPLITTING` | break off leading interjections into own sentence | `#$DO_NUMBER_MERGE` | merge multiple word numbers into one (*four and twenty*) | `#$DO_PROPERNAME_MERGE` | merge multiple proper name into one (*George Harrison*) | `#DO_DATE_MERGE` | merge month day and/or year sequences (*January 2, 1993*) | `#JSON_DIRECT_FROM_OOB` | asking the tokenizer to directly process OOB data. See `^jsonparse` in JSON manual. | `#NO_FIX_UTF` | do not adjust inputs with html or utf8 encodings to simple ascii. | `#TOKENIZE_BY_CHARACTER` | Every non-whitespace character becomes its own token and canonical form. (good for Japanese)

If any of the above items affect the input (except `TOKENIZE_BY_CHARACTER`), they will be echoed as values into `%tokenFlags` so you can detect they happened. The next changes do not echo into `%tokenFlags` and relate to grammar of input:

flag	description
<code>DO_POSTAG</code>	allow pos-tagging (labels like <code>~noun</code> <code>~verb</code> become marked)
<code>DO_PARSE</code>	allow parser (labels for word roles like <code>~main_subject</code> )
<code>DO_CONDITIONAL_POSTAG</code>	perform pos-tagging only if all words are known. Avoids wasting time on foreign sentences in particular
<code>NO_CONDITIONAL_IDIOM</code>	will not perform substitutions in the dictionary which are considered conditional idioms
<code>NO_ERASE</code>	where a substitution would delete a word entirely as junk, don't
<code>DO_SPLIT_UNDERSCORES</code>	happens after all other input tokenization and adjustments except number merge, and separates words that have been conjoined either because the dictionary has them ( <i>credit_card</i> ) or because they were merged by proper name merging, or by substitution. The result is only words without underscores (excluding number words like <i>five_thousand_and_four</i> )
<code>MARK_LOWER</code>	if a word is considered a proper name in CS and is marked as an upper case word, this will force it to perform any markings for its lower case form as well. Sometimes users type stuff in upper case that really should be lower

Normally the system tries to outguess the user, who cannot be trusted to use correct punctuation or casing or spelling. These block that:

flag	description
STRICT_CASING	for 1st word of a sentence, assume user uses correct casing on words
NO_INFERENCE_QUESTION_MARK	system will not try to set the QUESTION-MARK flag if the user didn't input a ? and the structure of the input looks like a question
DO_SPELL_CHECK	internal spell checking

flag	description
ONLY_UPPERCASE	input (except "I") to be lower case, refuse to recognize upper-case forms of anything
NO_IMPERATIVE	don't
NO_WITHIN	match fragments within a composite word
NO_SENTENCE	break input into sentences

Normally the tokenizer breaks apart some kinds of sentences into two. These prevent that:

flag	description
NO_COLON	break apart a sentence after a colon

flag	description
NO_SEMICOLON_END	break apart a sentence after a semi-colon
UNTOUCHED_INPUT	this alone, will tokenize only on spaces, leaving everything but spacing untouched

flag	description
LEAVE_QUOTE	<p>If the output is found within " " it will become a single token exactly as it is seen.</p> <p>W/o Leave_Quote, it is converted into a word without quotes and using underscores instead of spaces.</p> <p>So “My Fair Lady” becomes My_Fair_Lady, which would match a movie title if you had one, unlike <i>My Fair Lady</i> becoming the resulting token 33 and unrecognized</p>

flag	description
SPLIT_QUOTES	if output is found within " " the quotes will be removed.

Note

you can change `$cs_token` on the fly and force input to be reanalyzed via `^retry(SENTENCE)`. I do this when I detect the user is trying to give his name, and many foreign names might be spell-corrected into something wrong and the user is unlikely to misspell his own name.

Just remember to reset `$cs_token` back to normal after you are done. Here is one such way, assuming `$stdtoken` is set to your normal tokenflags in your bot definition outputmacro:

```
#! my name is Rogr
s: (name is _*)

    if ($cs_token == $stdtoken)
    {
        $cs_token = #DO_INTERJECTION_SPLITTING |
                    #DO_SUBSTITUTE_SYSTEM | #DO_NUMBER_MERGE |
                    #DO_PARSE
        retry(SENTENCE)
    }
    _0 is the name.
    $cs_token = $stdtoken
```

If you type *my name is Rogr* into a topic with this, the original input is spell-corrected to *my name is Roger*, but this will change the `$cs_token` over to one without spell correction and redo the sentence, which will now come back with *my name is Rogr* and be echoed correctly, and `$cs_token` reset.

That's assuming nothing else would run differently and trap the response elsewhere. If you were worried about that, it would be possible for the script to save where it is using `^getrule(tag)` and modify your control script to return immediate control to here after input processing if you had changed `$cs_token`.

## %tokenflags

These are the values that %tokenflags may have after analysis of a sentence...

```
#define PRESENT 0x0000000000002000ULL
```

```
#define PAST 0x0000000000004000ULL // basic tense- both present perfect  
and past perfect map to it #define FUTURE 0x0000000000008000ULL  
#define PRESENT_PERFECT 0x0000000000010000ULL // distinguish PAST  
PERFECT from PAST PRESENT_PERFECT #define CONTINUOUS  
0x0000000000002000ULL  
#define PERFECT 0x0000000000004000ULL  
#define PASSIVE 0x0000000000008000ULL
```

**define IMPLIED\_\_SUBJECT**

**define QUESTIONMARK**

**define EXCLAMATIONMARK**

**define PERIODMARK**

**define USERINPUT**

**define COMMANDMARK**

**define IMPLIED\_\_YOU**

**FOREIGN\_\_TOKENS**

**FAULTY\_\_PARSE**

**QUOTATION**

**NOT\_\_SENTENCE**

One or more of these will be set if input was changed do to use of these files

```
#DO_ESSENTIALS  
#DO_SUBSTITUTES  
#DO_CONTRACTIONS  
#DO_INTERJECTIONS  
#DO_BRITISH  
#DO_SPELLING  
#DO_TEXTING  
#DO_NOISE  
#DO_PRIVATE  
#DO_NUMBER_MERGE
```

```
#DO_PROPERNAME_MERGE
#DO_SPELLCHECK
#DO_INTERJECTION_SPLITTING
```

## Private Substitutions

While in general, substitutions are defined in the LIVEDATA folder, you can define private substitutions for your specific bot using the scripting language. You can say

```
replace: xxx yyyyy
```

which defines a substitution just like a livedata substitution file. It actually creates a substitution file called `private0.txt` or `private1.txt` in your TOPIC folder.

Even then, those substitutions will not be enacted unless you explicitly add to the `$cs_token` value `#DO_PRIVATE`, eg

```
$cs_token = #DO_INTERJECTION_SPLITTING |
            #DO_SUBSTITUTE_SYSTEM |
            #DO_NUMBER_MERGE |
            #DO_PROPERNAME_MERGE |
            #DO_SPELLCHECK |
            #DO_PARSE |
            #DO_PRIVATE
```

The left side of the substitution pair is case insensitive (matches either case on input) and can be placed in double-quotes (which converts spaces to underscores internally).

The right side of the substitution pair is case sensitive and can be placed in double-quotes (which converts spaces to plus signs internally).

Note: if you privately define a substitution that leads to a known interjection, it will be treated as an interjection, marked as `DO_INTERJECTIONS` rather than `DO_PRIVATE`. Interjections do not perform an actual substitution, does not replace the words on the left with the interjection concept name on the right. Instead interjections merely mark the phrase as being a member of that concept, leaving the actual words unchanged.

Similarly while canonical values of words can be defined in `LIVEDATA/SYSTEM/canonical.txt`, you can define private canonical values for your bots by using the scripting language. You can say:

```
canon: oh 0
canon: faster fast
```

which defines new canonical values for things and creates a file `canon0.txt` or `canon1.txt` in your TOPIC folder.

You can optionally add MORE\_FORM or MOST\_FORM as a 3rd argument, to set those flags for adjectives and adverbs.

If you want to set a canonical pair from a table during compilation, you can use a function to do the same thing (but only 1 pair at a time).

```
^canon(word canonicalform)
```

## Numeric Substitutions

A special kind of private substitution (equally applicable in regular substitution files) is the numeric substitution.

```
replace: ?_km kilometers
```

The ?\_ matches a digit number followed immediately by km, like 1.2km and will separate the number and replace the units with the given replacement. The input can be singular or have an 's' like 10.5dollars. And it can be with or without abbreviation periods, like 10kps or 10k.p.s

## Apostrophe Substitutions replace

```
replace: 'xxx yyy
```

allows you to split during tokenization any word followed by 'xxx into two words, original sans 'xxx and yyy. eg

```
replace: 've have
```

gives “companies’ve =>”companies have“.

## Replacing to a word with + in it

Normally `replace: x y+z` will generate 2 words, y and z. If you need a plus in your word, you can escape your 2nd word:

```
replace: "black and decker" \BLACK+DECKER
```

## Advanced replace substitution

You can name a pattern (which can extend over multiple lines) that can conditionally change the matched word into any other word or remove it or do nothing. Matching starts with \_0 having been assigned to the location of the word/phrase to replace.

```
replace: bubble_tea ([
    (is $$cs_replace:=2)
    (has $$cs_replace=null)
    (@_0- *~2 my $$cs_replace:=1)
])
"bubble tea is" -> 2 is
```

```
"bubble tea has" -> has
"my green bubble tea loves" -> my green 1 loves
```

You cannot use concepts in these patterns, nor the canonical forms of words. Your replacement data must be only tokens potentially separated by +, and potentially having \_ in them. Do not use double quotes.

## Interchange Variables

The following variables can be defined in a script and the engine will react to their contents.

interchange variable	description
<code>\$cs_token</code>	described exten- sively above

interchange variable	description
<code>\$cs_response</code>	controls auto- matic han- dling of outputs to user. By default it consists of <code>\$cs_response</code> = <code>#Response_upperstart</code>   <code>#response_removespacebeforecomma</code>   <code>#response_alterunderscores</code>   <code>#response_removetilde</code> If you want none of theses, use <code>\$cs_response</code> = 0 (all flags turned off). See <code>^print</code> for expla- nation of flags. <code>#response_noconvertspecial</code> - leave escaped n r and t alone in output and <code>^log</code> , 39 <code>#response_upperstart</code> - makes the first letter of an output sen- tence

interchange variable	description
<code>\$cs_crashmsg</code>	in server mode, what to say if the server crashes and we return a mes- sage to the user. By default the mes- sage is <i>Hey, sorry. I forgot what I was thinking about.</i>
<code>\$cs_abstract</code>	used with :abstract

interchange variable	description
<code>\$cs_trace</code>	if this variable is defined, then whenever the user's volley is finished, the value of this variable is set to that of <code>:trace</code> and <code>:trace</code> is cleared to 0, but when the user is read back in, the <code>:trace</code> is set to this value. For a server, this means you can perform tracing on a user w/o making all user transactions dump trace data

interchange variable	description
<code>\$cs_control_pre</code>	name of topic (flag it SYS-TEM) to run in gambit mode on pre-pass, set by author. Runs before any sentences of the input volley are analyzed. Good for setting up initial values
<code>\$cs_usermessagelimit</code>	max number of message pairs (user input & bot output) saved in topic file

interchange variable	description
<code>\$cs_externaltag</code>	name of a topic to use to replace existing internal English pos- parser. See bottom of ChatScript PosParser manual for details

interchange variable	description
<code>\$cs_prepass</code>	<p>name of a topic (mark it SYS-TEM) to run in responder mode on main volleys, which runs before <code>\$cs_control_main</code> and after all of the above and pos-parsing is done. Used to amend preparation data coming from the engine. You can use it to add your own spin on input processing before going to your main control. I use it to, for example, label commands</p>

interchange variable	description
<code>\$cs_control_main</code>	name of topic (flag it SYS- TEM) to run in re- sponder mode on main volleys, set by author
<code>\$cs_control_post</code>	name of topic (flag it SYS- TEM) to run in gambit mode on post- pass, set by author
<code>\$botprompt</code>	message for console window to label bot output
<code>\$userprompt</code>	message for console window to label user input line

interchange variable	description
<code>\$cs_crashmsg</code>	message to use if a crash occurs. see also <code>\$cs_crash</code>
<code>\$cs_crash</code>	topic to execute in gambit mode if a crash occurs. see also <code>\$cs_crashmsg</code>
<code>\$cs_language</code>	if spanish, will adjust spell check- ing for spanish colloquial

interchange variable	description
<code>\$cs_token</code>	bits control- ling how the tok- enizer works. By default when null, you get all bits as- sumed on. The possible values are in src/dictionarySystem.h (hunt for \$token) and you put a # in front of them to gen- erate that named nu- meric constant

interchange variable	description
<code>\$cs_abstract</code>	topic used by :ab- stract to display facts if you want them displayed
<code>\$cs_prepass</code>	topic used be- tween parsing and running user control script. Useful to sup- plement parsing, setting the ques- tion value, and revising input idioms

interchange variable	description
<code>\$cs_wildcardseparator</code>	when a match variable covers multiple words, what should separate them by default it's a space, but underscore is handy too. Initial system character is space, creating fidelity with what was typed. Useful if <code>_</code> can be recognized in input (web addresses). Changing to <code>_</code> is consistent with multi-word representation and keyword recogni-

interchange variable	description
<b>\$cs_userfactlimit</b>	how many of the most recent permanent facts created by the script in response to user inputs are kept for each user. Std default is 100. * means all.
<b>\$cs_outputchoice</b>	for regression: forces specific one of a [] [] output choice block - base 0
<b>\$cs_response</b>	controls some characteristics of how responses are formatted

interchange variable	description
<code>\$cs_randIndex</code>	the random seed for this volley

interchange variable	description
<code>\$cs_utcoffset</code>	<p>if defined, then %time returns current utc time + time-zone offset. The offset is usually a simple number, meaning hours, and can have + or - in front of it. It can also be a normal time reference like 02:30 which means plus 2 hours and 30 minutes beyond utc, or - 01:30:20 which means 1 hour, 30 minutes, and 20 seconds before utc (as if anyone would</p>

interchange variable	description
<code>\$\$db_error</code>	error mes- sage from a post- gres failure \$\$find- text_start - ^find- text return the end nor- mally, this is where it puts the start
<code>\$\$tcpopen_error</code>	error mes- sage from a tcpopen error
<code>\$\$document</code>	name of the doc- ument being read in docu- ment mode
<code>\$cs_randindex</code>	current value of the random genera- tor value

interchange variable	description
<code>\$cs_bot</code>	name of the bot cur- rently in use
<code>\$cs_login</code>	login name of the user
<code>\$\$csmatch_start</code>	start of found words from ^match
<code>\$\$csmatch_end</code>	end of found words from ^match
<code>\$cs_fullfloat</code>	if defined, causes the system to gen- erate full float 64-bit preci- sion on out- puts, other- wise you get 2 digit preci- sion by default

interchange variable	description
\$cs_botid	when non-zero creates facts and functions restricted by this bit-mask so facts and functions created by other masks cannot be seen. allows you to separate facts and functions per bot in a multi-bot environment. During compilation if this is set by a bot: command, then functions created and facts created by tables

interchange variable	description
<code>\$cs_numbers</code>	if defined, causes the system to output numbers in a different language style: french, indian. All other values are english.
<code>%trace_on</code> and <code>%trace_off</code>	Pseudo system variable used by the ^test-pattern and ^testout-put call to let code request a trace be returned.

interchange variable	description
<code>\$cs_indentlevel</code>	controls indenting when tracing in ^test-pattern. 3 is a good number usually
<code>\$indentlevel</code>	deprecated form of <code>\$cs_indentlevel</code>
<code>\$cs_tracetestoutput</code>	set to 1 to force tracing in ^testoutput
<code>\$cs_outputlimit</code>	Generating more output than this will report a bug into LOGS/bugs.txt
<code>\$cs_summary</code>	After volley prints to terminal milliseconds of time used in preparation, rules, postprocessing

interchange variable	description
<code>\$cs_showtime</code>	After volley prints to terminal milliseconds of time used
<code>\$cs_new_user</code>	set to 1, treat user as always new (don't try to read topic file)
<code>\$cs_jid</code>	number to start with when starting indexing of new json structure ids
<code>\$cs_directfromoob</code>	when set to true tells cs to convert any incoming oob directly into a json structure

## hook functions

`$cs_beforereset` | if set to a topic, will be executed before `:reset` is executed |  
`$cs_addressponse` | provides a function name hook onto the output `q` to the user. |  
`$testpatternpretopic` | execute this topic to preprocess input before matchines |  
`$$cs_testpatterninput` | a copy of user input created by engine for `$testpatternpretopic` to change if it wants |  
`$testpattern_posttopic` | can name a topic to be executed after `^testpattern` to alter returned new variables |

## variables to limit effort

`$cs_topicretrylimit` | if defined changes how many times you can pass back `RETRY_TOPIC` before it fails (current limit is 30) |  
`$$topic_retry_limit_exceeded` | set if topic retry limit is encountered |  
`$cs_userhistorylimit` | if not null, indicates how many volleys back are tracked as what was said by both parties |  
`$cs_sentences_limit` | after this many sentences in volley, cs ignores the rest (default 50) |  
`$cs_inputlimit` | Restrict user input size (excluding oob) |  
`$cs_loopleft` | `loop()` defaults to 1000 iterations before stopping. You can change this default with this |  
`$cs_analyzezlimit` | in non-standalone mode, after this millisecond limit, cs stops NL analysis of more sentences |  
`$cs_analyzezlimitlog` | if `analyzezlimit` triggers, report this fact in bug log |  
`$FakeTimeOffset` | For testing `analyzezlimit`, pretend this much ms has already lapsed on start |  
`$cs_badspelllimit` | x-y format. After x many spelling corrections or x/y ratio of badspells to words seen, stop spellchecking |  
`$cs_sequence` | How many words in sequence to check as a composite (default: 5) |

## JSON variables

`$cs_jsontimeout` | seconds before `JsonOpen` declares a time out failure. If unspecified the default is 300 |  
`$cs_saveusedJson` | if not null, the only JSON facts CS will write into the user's topic files that are referred to (directly or indirectly) from user variables being saved. (see below) |  
`$cs_proxycredentials` | See `^JSONOPEN` in JSON manual|  
`$cs_proxyserver` | See `^JSONOPEN` in JSON manual|  
`$cs_proxymethod` | See `^JSONOPEN` in JSON manual|  
`$correlation_id` | See `^JSONOPEN` in JSON manual|

## Mongo variables

**\$cs\_mongoqueryparams** | set as a json structure of move its fields to a mongo query |  
**\$mongo\_enable\_ssl** | if set to true, will use ssl |  
**\$mongossllcafile** | data for ssl |  
**\$mongosslpemfile** | data for ssl |  
**\$mongosslpempwd** | data for ssl |  
**\$mongovalidatessl** | data for ssl |  
**\$mongo\_timeexcess** | if certain operations exceed this ms, log entry is created |  
**\$\$mongo\_error** | error message if db not openable |

Note for %trace\_on and %trace\_off - you can use the command line parameter **blockapitrace** to prevent tracing in any code you accidentally leave in place.

**\$cs\_saveusedJson** exists as a kind of garbage collection. Nowadays most facts will come from JSON data either from a website or created in script. But keeping on top of deleting obsolete JSON may be overlooked. When this variable is non-null, ChatScript will automatically destroy any JSON fact that cannot trace a JSON fact path back to some user variable. Variables that have as values the name of a JSON object or array automatically protect all JSON facts underneath. JSON references merely within some text string will not protect anything, nor will references from some other non-JSON fact.

**\$cs\_inputlimit=x:y** for excessively long user input (excluding oob portion), the input will be truncated by keeping the first x characters and the last y characters.

**\$cs\_crash** - This topic can generate an appropriate dummy output and CS completes that volley but does not save an updated user file. The NEXT volley coming in will force cs to completely reload itself before processing. Making a dummy output hopefully means the same fatal input will not be sent back into CS to crash it again (due to external retry when no answer is received from CS). E.g.,

```
topic: ~crashtopic system ()
t: Huh?
```

**\$cs\_addresponse** names a function of 2 arguments that will be called when CS wants put text into the output queue of the user. The first argument will be what CS wants to output. The second is the rule tag that generated this output. If the function returns a failure code, the message will be aborted and not put into the queue. If the function returns a text value (not null) then that message will replace what was intended to go to the user.
