- Engine-defined Concepts
- System Variables
- Control over Input
- Interchange Variables

Engine-defined concepts

In addition to concepts defined in script files, the system automatically defines a bunch of dictionary-based sets as well as dynamically computed concept members.

set	description
~web_url	word is a web url
~email_url	word is an email address
~kindergarten	word learned early in life
~grade1_2	word learned in these grades
~grade3_4	word learned in these grades
~grade_5-6	word learned in these grades.
	Unmarked words are learned
	even later
~utf8	word has nonascii characters
~daynumber	word could be a number of a day
	in a month
~yearnumber	word could be the number of a
	recent year
~dateinfo	phrase is month day year of
	some kind
~kelvin	temperature marker
~celcius	temperature marker
~fahrenheit	temperature marker
~twitter_name	twitter user name
~hashtag_label	twitter topic reference

Interjections, "discourse acts", and concept sets

Some words and phrases have interpretations based on whether they are at sentence start or not. E.g., good day, mate and It is a good day are different for good day.

Likewise sure and I am sure are different.

Words that have a different meaning at the start of a sentence are commonly called interjections.

In ChatScript these are defined by the livedata/interjections.txt file. In addition, the file augments this concept with "discourse acts", phrases that are like an interjection. All interjections and discourse acts map to concept sets, which come thru as the user input instead of what they wrote.

For example yes and sure and of course are all treated as meaning the discourse act of agreement in the interjections file. So you don't see yes, I will go coming out of the engine.

The interjections file will remap that to the sentence \sim yes, breaking off that into its own sentence, followed by I will qo as a new sentence.

These generic interjections (which are open to author control via interjections.txt) are:

interjection	description
~yes	
~no	
~emomaybe	
~emohello	
~emogoodbye	
~emohowzit	
~emothanks	
~emolaugh	
~emohappy	
~emosad	
~emosurprise	
$\mbox{-emomisunderstand}$	
~emoskeptic	
~emoignorance	
~emobeg	
~emobored	
~emopain	
~emoangry	
~emocurse	
~emodisgust	
~emoprotest	
~emoapology	
~emomutual	

Because all interjections at the start of a sentence are broken off into their own sentence, this kind of pattern does not work:

u: (~yes _*)

You cannot capture the rest of the sentence here, because it will be part of the next sentence instead. This means interjections act somewhat differently from other concepts.

If you use a word in a pattern which may get remapped on input, the script compiler will issue a warning. Likely you should use the remapped name instead.

The following concepts are triggered by exactly repeating either the chatbot or oneself (to a repeat count of how often repeated). Repeats are within a recency window of about 20 volleys.

concept	description
~repeatme	
~repeatinput1	
~repeatinput2	
~repeatinput3	
~repeatinput4	
~repeatinput5	
~repeatinput6	

POS (Part of Speech) Tags

Words will have pos-tags attached, specififying both generic and specific tag attributes, eg., ~noun, ~noun_singular.

Generic Specifics

nouns	$\operatorname{description}$
~noun	
~noun_singular	
~noun_plural	
~noun_proper_singular	
~noun_proper_plural	
~noun_gerund	
~noun_number	
~noun_infinitive	
~noun_omitted_adjective	
verbs	description
~verb	
~verb_present	

verbs	description
~verb_present_3ps	
~verb_infinitive	
~verb_present_participle	
~verb_past	
~verb_past_participle	
~aux_verb	
~aux_verb_present	
~aux_verb_past	
~aux_verb_future	
~aux_verb_tenses	
~aux_be	
~aux_have	
~aux_do	

Auxilliary verbs are segmented into normal ones and special ones. Normal ones give their tense directly. Special ones give their root word. The tense of the be/have/do verbs can be had via 'properties() and testing for verb tenses

adjectives	description
~adjective	
~adjective_normal	
~adjective_number	
~adjective_noun	
~adjective_participle	
adjectives in comparative form	n description
~more_form~most_form	
~adverb	

adverbs in comparative form

description

- ~more_form~most_form
- ~pronoun~pronoun_subject~pronoun_object
- ~conjunction_bits~conjunction_coordinate~conjunction_subordinate
- ~determiner_bits~determiner~pronoun_possessive~predeterminer
- ~possessive
- ~to_infinitive
- ~preposition~particle

covers ' and 's at end of word "to" when used before a noun free-floating preposition tied t

adverbs in comparative form	description	
~comma		
~quote	covers ' and _"_ when not en	
~paren	covers opening and closing pa	
~foreign_word	some unknown word	
~there_existential	the word there used existential	

In addition to normal generic kinds of pos tags, words which are serving a pos-tag role different from their putative word type are marked as members of the major tag they act as part of. E.g,

	description
~noun_gerund	verb used as a
	~noun
~noun_infinitive	verb used as a
	~noun
~noun_omitted_adjective	an adjective
	used as a
	collective noun
	(eg the beautiful
	$are \ kind)$
~adjectival_noun	noun used as
	adjective like
	bank "bank
	teller"
~adjective_participle	verb participle
	used as an
	adjective

For ~noun_gerund in *I like swimming* the verb gerund *swimming* is treated as a noun (hence called noun-gerund) but retains verb sense when matching keywords tagged with part-of-speech (i.e., it would match swim~v as well as swim~n).

Additionally, there is

	description
~number	is not a part of speech, but is comprise of rnoun_number (a normal number value like 17 or seventeen)
~adjective_number	also a normal numeral value and also ~placenumber) like first.
~integer	·
~float ~positiveinteger	
~negativeinteger	
~modelnumber	not a true number, but a word with both alpha and numeric
~filename	looks like a filename with extension
~modelnumber	not a true number, but a word with both alpha and numeric
~prep_phrase	chunk of text forming a prepositional phrase
~verb_phrase	chunk of text forming a verb phrase
~noun_phrase	chunk of text forming a noun phrase

[&]quot;To" can be a preposition or it can be special. When used in the infinitive phrase To go, it is marked $\sim to_infinitive$ and is followed by $\sim noun_infinitive$.

	description
~verb_infinitive	refers to a match on the infinitive form of the verb (<i>I hear John sing</i> or <i>I will sing</i>).
~There_existential	refers to the use of where not involving location, meaning the existence of, as in There is no future.
~Particle	refers to a preposition piece of a compound verb idiom which allows being separated from the verb. If you say I will call off the meeting, call_off is the composite verb and is a single token. But if you split it as in I will call the meeting off, then there are two tokens. The original form of the verb will be call and the canonical form of the verb will be call_off, while the free-standing off will be labeled

	description
~verb_present	will be used for
	normal present
	verbs not in
	third person
	singular like I
	walk and
~verb_present_3ps	will be used for
-	things like he
	walks
~possesive	refers to ' s and
	'that indicate
	possession,
	while possessive
	pronouns get
	their own
	labeling
	~pronoun_possessive
~pronoun_subject	is a pronoun
	used as a
	subject (like he)
~pronoun_object	refers to
	objective form
	like <i>him</i>

Individual words serve roles in the parse of a sentence, which are retrievable. These include:

	description
~mainsubject	
~mainverb	
~mainindirect	
~maindirect	
~subject2	
~verb2	
~indirectobject2	
~object2	
~subject_complement	adjective object
	of sentence
	involving
	linking verb

	description
~object_complement	2ndary noun or
	infinitive verb
	filling
	modifying
	mainobject or
	object2
~conjunct_noun~conju	
~postnominalAdjective	_
•	occuring
	AFTER the
	noun it
	modified
~reflexive	reflexive
	pronouns
~not	r
~address	noun used as
	addressee of
	sentence
~appositive	noun restating
-FF	and modifying
	prior noun
~absolutephrase	special phrase
The state of the s	describing
	whole sentence
~omittedtimeprep	modified time
om2000002	word used as
	phrase but
	lacking
	preposition
	(Next tuesday I
	$will\ go)$
~nhrage	a prepositional
~phrase	
	phrase start
3	(except
~clause	a subordinate
• •	clause start
~verbal	a verb phrase

and special concepts: $| \sim capacronym | word is in all caps (and &) and is likely an acronym | <math>\sim emoji | word starts and end with : and represents an emoji$

Spanish

For Spanish (if you are in spanish language mode) there is ~spanish_he, ~spanish_she, ~spanish_singular, ~spanish_plural for nouns and adjectives and determiner 'the'. Pronouns will be marked with ~pronoun_object_singular or ~pronoun_object_plural or ~pronoun_object_you. Also ~pronoun_indirectobject_singular and ~pronoun_indirectobject_plural and ~pronoun_indirectobject_you. Also ~pronoun_I and ~pronoun_you. And simple future tense verbs will be marked ~spanish_future.

System Variables

The system has some predefined variables which you can generally test and use but not normally assign to. These all begin with %. Ones that are reasonable to set are written in bold underline. Boolean values are always 1 or null on returns. 1 or 0 if you are setting them.

Date & Time & Numbers

variable	description
%date	one or two digit day of the month
%day	Sunday, etc
%daynumber	r1-7 where $1 = Sunday$
%fulltime	seconds representing the current time and date (Unix epoch time)
%fullmstin	newumeric full time/date in milliseconds (Unix
	epoch time)
%hour	0-23
%timenumbe	erempletely consistent full time info in numbers
	that you can do _0 =
	^burst(%timenumbers) to get _0 = seconds
	(2digit) _1=minutes (2digit) _2=hours (2digit)
	_3=dayinweek(0-6 Sunday=0) _4=dateinmonth
	(1-31) $_5$ =month(0-11 January=0) $_6$ =year.You
	need to get it simultaneously if you want to do
	accurate things with current time, since
	retrieving %hour %minute separately allows
	time to change between calls
%leapyear	boolean if current year is a leap year
%daylight:	savoings if current within daylight savings
%minute	0-59
month	1-12 (January = 1)
%monthname	January, etc
%second	0-59

variable	description	
%volleytimeumber of seconds of computation since volley		
	input started	
%time	hh:mm in military 24-hour time	
%zulutime	2016-07-27T11:38:35.253Z	
%week	1-5 (week of the month)	
%year	e.g., 2011	
%rand	get a random number from 1 to 100 inclusive	

Time and date information are normally local, relative to the system clock of the machine CS is running on. See \$cs_utcoffset for adjusting time based on relationship to utc (e.g your server is in Virginia and you are in Colorado).

%rand is only pseudo-random. A specific username is assigned a seed based on their name. Thereafter the seed evolves by the dialog but it is repeatable when the same user starts over again. If you want truly random, use %fullmstime % % \$howmany to get range 0 .. \$howmany-1

User Input

variable	description
%bot	current
	bot
	responding
%revisedinput	Boolean
_	is

	Responses

System variables

Note for all time variables, they normally use local machine time. If you have a \$cs_utcoffset variable with a value, then all time will be relative to GMT/UTC/Zulu (which means it doesn't pay attention to daylight savings and you have to do that yourself with the answer).

variable	description

	pattern
	being
	matched
	in
	^testpattern

%httpresponse returns the official http response codes when it succeeds in connecting to a server. When it fails, it returns various negative codes that are specific to curl.

- -1 timeout connection attempt was canceled or no time was allowed (instant fail)
- -2 couldn't connect or not resolve host or proxy
- -3 unsupported protocol
- -4 curl got nothing (typically sent http to https site)
- -5 malformed url
- -6 other
- -7 curl operation timeout

^testpattern control variables

 $\verb|\t kestpattern-prescan|| execute this pattern on all sentences before doing other patterns one-by-one$

%trace_on | starting here, do :trace pattern in ^testpattern %trace_on all | starting here, do :trace all in ^testpattern %trace_off | turn off tracing (also turns off at end of cs call)

Build data

variable	description
%dict	date/time the dictionary was built
%engine	date/time the engine was compiled
%os	os invovled (linux windows mac ios)
%script	date/time build1 was compiled
%version	engine version number

You actually can assign to any of them. This will override them and make them return what you tell them to and is a particularly BAD thing to do if this is running on a server since it affects all users (unless you reset the variable at the end of the volley. Assigning a period to a variable resets it).

Typically one does this as a temporary assignment in a #! comment line to set up conditions for testing using :verify.

Making them return a new value is NOT the same thing as making the engine have a different value. Unless the variable is marked as settable, setting a value affects only the value returned by a future call to the system variable. It does not change engine values the variable is meant to reflect.

Control Over Input

The system can do a number of standard processing on user input, including spell correction, proper-name merging, expanding contractions etc. This is managed

by setting the user variable \$cs_token.

The default \$cs_token that comes with Harry is:

The #signals a named constant from the dictionarySystem.h file. One can set the following:

These enable various LIVEDATA files to perform substitutions on input:

flag	description
#DO_ESSENTIALS	perform LIVEDATA/systemessentials which
	mostly strips off trailing punctuation and sets
	corresponding flags instead
#DO_SUBSTITUTES	perform LIVEDATA/substitutes
#DO_CONTRACTIONS	perform LIVEDATA/contractions, expanding
	contractions
#DO_INTERJECTIONS	perform LIVEDATA/interjections, changing
	phrases to interjections
#DO_BRITISH	perform LIVEDATA/british, respelling brit words
	to American
#DO_SPELLING	performs the LIVEDATA/spelling file (manual
_	spell correction)
#DO_TEXTING	performs the LIVEDATA/texting file (expand
_	texting notation)
#DO_SUBSTITUTE_SYSTEM	do all LIVEDATA file expansions

The contents of the files above are pairs of tokens per line. Left is the word to replace and right is the replacement. When multiple words are involved, the left side uses underscores to represent this and the right side uses +. If the right side is missing, it means just delete. | #DO_INTERJECTION_SPLITTING | break off leading interjections into own sentence | #\$DO_NUMBER_MERGE | merge multiple word numbers into one (four and twenty)

| #\$DO_PROPERNAME_MERGE | merge multiple proper name into one ($George\ Harrison$) | #DO_DATE_MERGE | merge month day and/or year sequences ($January\ 2$, 1993) | #JSON_DIRECT_FROM_OOB | asking the tokenizer to directly process OOB data. See ^jsonparse in JSON manual. | #NO_FIX_UTF | do not adjust inputs with html or utf8 encodings to simple ascii.

| #TOKENIZE_BY_CHARACTER | Every non-whitespace character becomes its own token and canonical form. (good for Japanese)

If any of the above items affect the input (except TOKENIZE_BY_CHARACTER), they will be echoed as values into <code>%tokenFlags</code> so you can detect they happened. The next changes do not echo into <code>%tokenFlags</code> and relate to grammar of input:

flag	description
DO_POSTAG	allow pos-tagging (labels like ~noun ~verb become marked)
DO_PARSE	allow parser (labels for word roles like ~main_subject)
DO_CONDITIONAL_POSTA	Operform pos-tagging only if all words are known. Avoids wasting time on foreign sentences in particular
NO_CONDITIONAL_IDIOM	will not perform substitutions in the dictionary which are considered conditional idioms
NO_ERASE	where a substitution would delete a word entirely as junk, don't
DO_SPLIT_UNDERSCORES	happens after all other input tokenization and adjustments except number merge, and separates words that have been conjoined either because the dictionary has them (credit_card) or because they were merged by proper name merging, or by substitution. The result is only words without underscores (excluding number words like five_thousand_and_four
MARK_LOWER	if a word is considered a proper name in CS and is marked as an upper case word, this will force it to perform any markings for its lower case form as well. Sometimes users type stuff in upper case that really should be lower

Normally the system tries to outguess the user, who cannot be trusted to use correct punctuation or casing or spelling. These block that:

```

Note

you can change \$cs_token on the fly and force input to be reanalyzed via ^retry(SENTENCE). I do this when I detect the user is trying to give his name, and many foreign names might be spell-corrected into something wrong and the user is unlikely to misspell his own name.

Just remember to reset \$cs_token back to normal after you are done. Here is one such way, assuming \$stdtoken is set to your normal tokenflags in your bot definition outputmacro:

If you type my name is Rogr into a topic with this, the original input is spell-corrected to my name is Roger, but this will change the \$cs_token over to one without spell correction and redo the sentence, which will now come back with my name is Rogr and be echoed correctly, and \$cs_token reset.

That's assuming nothing else would run differently and trap the response elsewhere. If you were worried about that, it would be possible for the script to save where it is using <code>fgetrule(tag)</code> and modify your control script to return immediate control to here after input processing if you had changed <code>\$cs_token</code>.

%tokenflags

These are the values that %token flags may have after analysis of a sentence... #define PRESENT 0x000000000000000U LL #define PAST 0x0000000000000000000ULL // basic tense- both present perfect and past perfect map to it #define FUTURE 0x00000000000000000ULL #define PRESENT_PERFECT 0x0000000000000ULL // distinguish PAST PERFECT from PAST PRESENT_PERFECT #define CONTINUOUS 0x00000000000000000ULL

#define PERFECT 0x0000000000040000ULL #define PASSIVE 0x00000000000000000ULL

define USERINPUT

define COMMANDMARK

define IMPLIED_YOU

FOREIGN TOKENS

FAULTY_PARSE

QUOTATION

NOT_SENTENCE

One or more of these will be set if input was changed do to use of these files

#DO ESSENTIALS

#DO_SUBSTITUTES

#DO_CONTRACTIONS

#DO_INTERJECTIONS

#DO_BRITISH

#DO_SPELLING

#DO_TEXTING

#DO_NOISE

#DO_PRIVATE

#DO_NUMBER_MERGE

```
#DO_PROPERNAME_MERGE
#DO_SPELLCHECK
#DO_INTERJECTION_SPLITTING
```

Private Substitutions

While in general, substitutions are defined in the LIVEDATA folder, you can define private substitutions for your specific bot using the scripting language. You can say

```
replace: xxx yyyyy
```

which defines a substitution just like a livedata substitution file. It actually creates a substitution file called privateO.txt or private1.txt in your TOPIC folder.

Even then, those substitutions will not be enacted unless you explicitly add to the \$cs_token value #DO_PRIVATE, eg

```
$cs_token = #DO_INTERJECTION_SPLITTING |
    #DO_SUBSTITUTE_SYSTEM |
    #DO_NUMBER_MERGE |
    #DO_PROPERNAME_MERGE |
    #DO_SPELLCHECK |
    #DO_PARSE |
    #DO_PRIVATE
```

The left side of the substitution pair is case insensitive (matches either case on input) and can be placed in double-quotes (which converts spaces to underscores internally).

The right side of the substitution pair is case sensitive and can be placed in double-quotes (which converts spaces to plus signs internally).

Note: if you privately define a substitution that leads to a known interjection, it will be treated as an interjection, marked as DO_INTERJECTIONS rather than DO_PRIVATE. Interjections do not perform an actual substitution, does not replace the words on the left with the interjection concept name on the right. Instead interjections merely mark the phrase as being a member of that concept, leaving the actual words unchanged.

Similarly while canonical values of words can be defined in LIVEDATA/SYSTEM/canonical.txt, you can define private canonical values for your bots by using the scripting language. You can say:

```
canon: oh 0
canon: faster fast
```

which defines new canonical values for things and creates a file canon0.txt or canon1.txt in your TOPIC folder.

You can optionally add MORE_FORM or MOST_FORM as a 3rd argument, to set those flags for adjectives and adverbs.

If you want to set a canonical pair from a table during compilation, you can use a function to do the same thing (but only 1 pair at a time).

Numeric Substitutions

A special kind of private substitution (equally applicable in regular substitution files) is the numeric substitution.

```
replace: ?_km kilometers
```

The ?_ matches a digit number followed immediately by km, like 1.2km and will separate the number and replace the units with the given replacement. The input can be singular or have an 's' like 10.5dollars. And it can be with or without abbreviation periods, like 10kps or 10k.p.s

Apostrophe Substitutions replace

replace: 'xxx yyy

allows you to split during tokenization any word followed by 'xxx into two words, original sans 'xxx and yyy. eg

replace: 've have

gives "companies've =>"companies have".

Replacing to a word with + in it

Normally replace: x y+z will generate 2 words, y and z. If you need a plus in your word, you can escape your 2nd word:

replace: "black and decker" \BLACK+DECKER

Interchange Variables

The following variables can be defined in a script and the engine will react to their contents.

interchange variable	description
\$cs_token	described
	exten-
	sively
	above

[^]canon(word canonicalform)

```
interchange variable
                      {\it description}

$cs_response
                      auto-
                      matic
                      han-
                      dling of
                      outputs
                      to user.
                      By
                      default
                      it
                      consists
                      of
                      $cs_response
                      #Response_upperstart
                      #response_removespacebeforecomma
                      #response_alterunderscores
                      #response_removetilde
                      If you
                      want
                      none of
                      theses,
                      use
                      cs_response
                      =0 (all
                      flags
                      turned
                      off).
                      See
                      ^print
                      for
                      expla-
                      nation
                      of flags.
                      #response_noconvertspecial
                      - leave
                      escaped
                      n r and
                      t alone
                      in
                      output
                      and
                      \log
             38
                      #response_upperstart
                      - makes
                      the first
                      letter of
                      an
                      output
                      sen-
                      tence
```

hook functions

\$cs_beforereset | if set to a topic, will be executed before :reset is executed |
\$cs_addresponse | provides a function name hook onto the output q to the
user. |

 $\verb§|testpatternpretopic|| execute this topic to preprocess input before matchines$

\$\$cs_testpatterninput | a copy of user input created by engine for \$testpatternpretopic to change if it wants |

\$testpattern_posttopic | can name a topic to be executed after ^testpattern to alter returned new variables |

variables to limit effort

\$cs_topicretrylimit | if defined changes how many times you can pass back RETRY TOPIC before it fails (current limit is 30) |

\$\$topic_retry_limit_exceeded | set if topic retry limit is encountered |

\$cs_userhistorylimit | if not null, indicates how many volleys back are tracked as what was said by both parties |

 $cs_sentences_limit \mid$ after this many sentences in volley, cs ignores the rest (default 50) \mid

\$cs_inputlimit | Restrict user input size (excluding oob) |

 $cs_{on} = 1000$ (defaults to 1000 iterations before stopping. You can change this default with this |

 $cs_analyzelimit \mid$ in non-standalone mode, after this millisecond limit, cs stops NL analysis of more sentences \mid

 $cs_{analyzelimitlog} \mid if analyzelimit triggers, report this fact in bug log \mid FakeTimeOffset \mid For testing analyzelimit, pretend this much ms has already$

 $cs_badspellLimit \mid x-y \text{ format. After } x \text{ many spelling corrections or } x/y \text{ ratio of badspells to words seen, stop spellchecking } \mid$

 $c=\$ How many words in sequence to check as a composite (default: 5) |

JSON variables

lapsed on start

 $cs_jsontimeout \mid$ seconds before JsonOpen declares a time out failure. If unspecified the default is 300 \mid

\$cs_saveusedJson | if not null, the only JSON facts CS will write into the user's topic files that are referred to (directly or indirectly) from user variables being saved. (see below) |

\$cs_proxycredentials | See ^JSONOPEN in JSON manual|

\$cs_proxyserver | See ^JSONOPEN in JSON manual|

\$cs proxymethod | See ^JSONOPEN in JSON manual|

\$correlation_id | See ^JSONOPEN in JSON manual|

Mongo variables

 $c_{mongoqueryparams} \mid set as a json structure of move its fields to a mongo query <math display="inline">\mid$

```
$mongo_enable_ssl | if set to true, will use ssl |
$mongosslcafile | data for ssl |
$mongosslpemfile | data for ssl |
$mongosslpempwd | data for ssl |
$mongovalidatessl | data for ssl |
$mongo_timeexcess | if certain operations exceed this ms, log entry is created |
$$mongo_error | error message if db not openable |
```

Note for %trace_on and %trace_off - you can use the command line parameter blockapitrace to prevent tracing in any code you accidentally leave in place.

\$cs_saveusedJson exists as a kind of garbage collection. Nowadays most facts will come from JSON data either from a website or created in script. But keeping on top of deleting obsolete JSON may be overlooked. When this variable is non-null, ChatScript will automatically destroy any JSON fact that cannot trace a JSON fact path back to some user variable. Variables that have as values the name of a JSON object or array automatically protect all JSON facts underneath. JSON references merely within some text string will not protect anything, nor will references from some other non-JSON fact.

\$cs_inputlimit=x:y for excessively long user input (excluding oob portion), the input will be truncated by keeping the first x characters and the last y characters.

\$cs_crash - This topic can generate an appropriate dummy output and CS completes that volley but does not save an updated user file. The NEXT volley coming in will force cs to completely reload itself before processing. Making a dummy output hopefully means the same fatal input will not be sent back into CS to crash it again (due to external retry when no answer is received from CS). E.g.,

```
topic: ~crashtopic system ()
    t: Huh?
```

\$cs_addresponse names a function of 2 arguments that will be called when CS wants put text into the output queue of the user. The first argument will be what CS wants to output. The second is the rule tag that generated this output. If the function returns a failure code, the message will be aborted and not put into the queue. If the function returns a text value (not null) then that message will replace what was intended to go to the user.
