# Engine-defined concepts

In addition to concepts defined in script files, the system automatically defines a bunch of dictionary-based sets as well as dynamically computed concept members.

| set            | description                     |
|----------------|---------------------------------|
| ~web_url       | word is a web url               |
| ~email_url     | word is an email address        |
| ~kindergarten  | word learned early in life      |
| ~grade1_2      | word learned in these grades    |
| ~grade3_4      | word learned in these grades    |
| ~grade_5-6     | word learned in these grades.   |
|                | Unmarked words are learned      |
|                | even later                      |
| ~utf8          | word has nonascii characters    |
| ~daynumber     | word could be a number of a day |
|                | in a month                      |
| ~yearnumber    | word could be the number of a   |
|                | recent year                     |
| ~dateinfo      | phrase is month day year of     |
|                | some kind                       |
| ~kelvin        | temperature marker              |
| ~celcius       | temperature marker              |
| ~fahrenheit    | temperature marker              |
| ~twitter_name  | twitter user name               |
| ~hashtag_label | twitter topic reference         |

## Interjections, "discourse acts", and concept sets

Some words and phrases have interpretations based on whether they are at sentence start or not. E.g., good day, mate and It is a good day are different for good day.

Likewise sure and I am sure are different.

Words that have a different meaning at the start of a sentence are commonly called interjections.

In ChatScript these are defined by the livedata/interjections.txt file. In addition, the file augments this concept with "discourse acts", phrases that are like an interjection. All interjections and discourse acts map to concept sets, which come thru as the user input instead of what they wrote.

For example yes and sure and of course are all treated as meaning the discourse act of agreement in the interjections file. So you don't see yes, I will go coming out of the engine.

The interjections file will remap that to the sentence  $\sim$ yes, breaking off that into its own sentence, followed by I will qo as a new sentence.

These generic interjections (which are open to author control via interjections.txt) are:

| interjection                 | description |
|------------------------------|-------------|
| ~yes                         |             |
| ~no                          |             |
| ~emomaybe                    |             |
| ~emohello                    |             |
| ~emogoodbye                  |             |
| ~emohowzit                   |             |
| ~emothanks                   |             |
| ~emolaugh                    |             |
| ~emohappy                    |             |
| ~emosad                      |             |
| ~emosurprise                 |             |
| $	ilde{\ }$ emomisunderstand |             |
| ~emoskeptic                  |             |
| ~emoignorance                |             |
| ~emobeg                      |             |
| ~emobored                    |             |
| ~emopain                     |             |
| ~emoangry                    |             |
| ~emocurse                    |             |
| ~emodisgust                  |             |
| ~emoprotest                  |             |

| interjection           | description |
|------------------------|-------------|
| ~emoapology ~emomutual |             |

Because all interjections at the start of a sentence are broken off into their own sentence, this kind of pattern does not work:

#### u: (~yes \_\*)

You cannot capture the rest of the sentence here, because it will be part of the next sentence instead. This means interjections act somewhat differently from other concepts.

If you use a word in a pattern which may get remapped on input, the script compiler will issue a warning. Likely you should use the remapped name instead.

The following concepts are triggered by exactly repeating either the chatbot or oneself (to a repeat count of how often repeated). Repeats are within a recency window of about 20 volleys.

| concept       | description |
|---------------|-------------|
| ~repeatme     |             |
| ~repeatinput1 |             |
| ~repeatinput2 |             |
| ~repeatinput3 |             |
| ~repeatinput4 |             |
| ~repeatinput5 |             |
| ~repeatinput6 |             |
|               |             |

## POS (Part of Speech) Tags

Words will have pos-tags attached, specififying both generic and specific tag attributes, eg., ~noun, ~noun\_singular.

#### Generic Specifics

| nouns                 | description |
|-----------------------|-------------|
| ~noun                 |             |
| ~noun_singular        |             |
| ~noun_plural          |             |
| ~noun_proper_singular |             |
| ~noun_proper_plural   |             |

| nouns                    | description |
|--------------------------|-------------|
| ~noun_gerund             |             |
| ~noun_number             |             |
| ~noun_infinitive         |             |
| ~noun_omitted_adjective  |             |
|                          |             |
| verbs                    | description |
| ~verb                    |             |
| ~verb_present            |             |
| ~verb_present_3ps        |             |
| ~verb_infinitive         |             |
| ~verb_present_participle |             |
| ~verb_past               |             |
| ~verb_past_participle    |             |
| ~aux_verb                |             |
| ~aux_verb_present        |             |
| ~aux_verb_past           |             |
| ~aux_verb_future         |             |
| ~aux_verb_tenses         |             |
| ~aux_be                  |             |
| ~aux_have                |             |
| ~aux_do                  |             |

Auxilliary verbs are segmented into normal ones and special ones. Normal ones give their tense directly. Special ones give their root word. The tense of the be/have/do verbs can be had via `properties() and testing for verb tenses

| adjectives                     | description   |
|--------------------------------|---------------|
| ~adjective                     |               |
| ~adjective_normal              |               |
| ~adjective_number              |               |
| ~adjective_noun                |               |
| ~adjective_participle          |               |
|                                |               |
| adjectives in comparative form | n description |
| ~more_form~most_form           |               |
| ~adverb                        |               |
| ~adverb_normal                 |               |

| adverbs in comparative form                                      | description                       |
|--|-----------------------------------|
| ~more_form~most_form   |                                   |
| ~pronoun~pronoun_subject~pronoun_object                          |                                   |
| ~conjunction_bits~conjunction_coordinate~conjunction_subordinate |                                   |
| ~determiner_bits~determiner~pronoun_possessive~predeterminer     |                                   |
| ~possessive  | covers 'and 's at end of word     |
| ~to_infinitive   | "to" when used before a noun      |
| ~preposition~particle  | free-floating preposition tied to |
| ~comma   |                                   |
| ~quote   | covers 'and _"_ when not en       |
| ~paren   | covers opening and closing par    |
| ~foreign_word  | some unknown word                 |
| ~there_existential   | the word there used existentia    |

In addition to normal generic kinds of pos tags, words which are serving a pos-tag role different from their putative word type are marked as members of the major tag they act as part of. E.g,

|                         | description       |
|-------------------------|-------------------|
| ~noun_gerund            | verb used as a    |
|                         | ~noun             |
| ~noun_infinitive        | verb used as a    |
|                         | ~noun             |
| ~noun_omitted_adjective | an adjective      |
|                         | used as a         |
|                         | collective noun   |
|                         | (eg the beautiful |
|                         | $are \ kind)$     |
| ~adjectival_noun        | noun used as      |
|                         | adjective like    |
|                         | bank "bank        |
|                         | teller"           |
| ~adjective_participle   | verb participle   |
|                         | used as an        |
|                         | adjective         |

For <code>~noun\_gerund</code> in *I like swimming* the verb gerund *swimming* is treated as a noun (hence called noun-gerund) but retains verb sense when matching keywords tagged with part-of-speech (i.e., it would match <code>swim~v</code> as well as <code>swim~n</code>).

Additionally, there is

|                   | description   |
|-------------------|---|
| ~number           | is not a part of speech, but is comprise of rnoun_number (a normal number value like 17 or seventeen) |
| ~adjective_number | also a normal<br>numeral value<br>and also<br>~placenumber)<br>like first.                            |
| ~integer          | J   |
| ~float            |   |
| ~positiveinteger  |   |
| ~negativeinteger  |   |
| ~modelnumber      | not a true<br>number, but a<br>word with both<br>alpha and<br>numeric                                 |
| ~filename         | looks like a<br>filename with<br>extension  |

To can be a preposition or it can be special. When used in the infinitive phrase To go, it is marked  $\neg to_infinitive$  and is followed by  $\neg noun_infinitive$ .

|                  | description           |
|------------------|-----------------------|
| ~verb_infinitive | refers to a           |
|                  | match on the          |
|                  | infinitive form       |
|                  | of the verb $(I$      |
|                  | hear John sing        |
|                  | or $I$ will $sing$ ). |

|                    | description                          |
|--------------------|--------------------------------------|
| ~There_existential | refers to the use of where not       |
|                    | involving                            |
|                    | location,                            |
|                    | meaning the                          |
|                    | existence of, as in There is no      |
|                    | future.                              |
| ~Particle          | refers to a                          |
| 1 al title         | preposition                          |
|                    | piece of a                           |
|                    | compound verb                        |
|                    | idiom which                          |
|                    | allows being                         |
|                    | separated from                       |
|                    | the verb. If you                     |
|                    | say $I$ will call                    |
|                    | off the meeting,                     |
|                    | call_off is the                      |
|                    | composite verb                       |
|                    | and is a single                      |
|                    | token. But if                        |
|                    | you split it as                      |
|                    | in $I$ will call the                 |
|                    | $meeting\ off,$                      |
|                    | then there are                       |
|                    | two tokens.                          |
|                    | The original                         |
|                    | form of the verb                     |
|                    | will be call and                     |
|                    | the canonical                        |
|                    | form of the verb                     |
|                    | will be call_off, while the          |
|                    |                                      |
|                    | free-standing off<br>will be labeled |
|                    | ~particle.                           |
| ~verb_present      | will be used for                     |
| . 51 5_P1 55 511 6 | normal present                       |
|                    | verbs not in                         |
|                    | third person                         |
|                    | singular like $I$                    |
|                    | walk  and                            |
|                    |                                      |

|                   | description  |
|-------------------|--|
| ~verb_present_3ps | will be used for<br>things like he<br>walks  |
| ~possesive        | refers to 's and 'that indicate possession, while possessive pronouns get their own labeling |
| ~pronoun_subject  | rpronoun_possessive. is a pronoun used as a subject (like he)                                |
| ~pronoun_object   | refers to objective form like $him$  |

Individual words serve roles in the parse of a sentence, which are retrievable. These include:

|                      | description      |
|----------------------|------------------|
| ~mainsubject         |                  |
| ~mainverb            |                  |
| ~mainindirect        |                  |
| ~maindirect          |                  |
| ~subject2            |                  |
| ~verb2               |                  |
| ~indirectobject2     |                  |
| ~object2             |                  |
| ~subject_complement  | adjective object |
|                      | of sentence      |
|                      | involving        |
|                      | linking verb     |
| ~object_complement   | 2ndary noun or   |
|                      | infinitive verb  |

## Spanish

For Spanish (if you are in spanish language mode) there is ~spanish\_he, ~spanish\_she, ~spanish\_singular, ~spanish\_plural for nouns and adjectives and determiner 'the'. Pronouns will be marked with ~pronoun\_object\_singular or ~pronoun\_object\_plural or ~pronoun\_object\_you. Also ~pronoun\_indirectobject\_singular and ~pronoun\_indirectobject\_plural and ~pronoun\_indirectobject\_you. Also ~pronoun\_I and ~pronoun\_you. And

simple future tense verbs will be marked  $\sim\!\!$  spanish\_future.

# System Variables

The system has some predefined variables which you can generally test and use but not normally assign to. These all begin with %. Ones that are reasonable to set are written in bold underline. Boolean values are always 1 or null on returns. 1 or 0 if you are setting them.

## Date & Time & Numbers

| variable  | description  |  |
|---|--|--|
| %date   | one or two digit day of the month                        |  |
| %day  | Sunday, etc  |  |
| %daynumber 1-7 where $1 = Sunday$                       |  |  |
| %fulltime   | seconds representing the current time and date           |  |
|   | (Unix epoch time)  |  |
| %fullmstim  | Numeric full time/date in milliseconds (Unix             |  |
|   | epoch time)  |  |
| %hour   | 0-23   |  |
| %timenumbe  | erempletely consistent full time info in numbers         |  |
|   | that you can do _0 =                                     |  |
|   | ^burst(%timenumbers) to get _0 = seconds                 |  |
| (2digit) _1=minutes (2digit) _2=hours (2digit)          |  |  |
| $_3$ =dayinweek(0-6 Sunday=0) $_4$ =dateinmonth         |  |  |
|   | $(1-31)$ _5=month $(0-11 \text{ January}=0)$ _6=year.You |  |
|   | need to get it simultaneously if you want to do          |  |
|   | accurate things with current time, since                 |  |
|   | retrieving %hour %minute separately allows               |  |
|   | time to change between calls                             |  |
|   | r boolean if current year is a leap year                 |  |
| %daylights&voinkgsn if current within daylight savings  |  |  |
| %minute   | 0-59   |  |
| %month  | 1-12 (January = 1)                                       |  |
| %monthnameJanuary, etc                                  |  |  |
| %second   |  |  |
| %volleytimeumber of seconds of computation since volley |  |  |
|   | input started  |  |
| %time   | hh:mm in military 24-hour time                           |  |
| %zulutime   | 2016-07-27T11:38:35.253Z                                 |  |
| %week   | 1-5 (week of the month)                                  |  |
| %year   | e.g., 2011   |  |
|   |  |  |

| variable | description                                 |
|----------|---|
| %rand    | get a random number from 1 to 100 inclusive |

Time and date information are normally local, relative to the system clock of the machine CS is running on. See \$cs\_utcoffset for adjusting time based on relationship to utc (e.g your server is in Virginia and you are in Colorado).

%rand is only pseudo-random. A specific username is assigned a seed based on their name. Thereafter the seed evolves by the dialog but it is repeatable when the same user starts over again. If you want truly random, use %fullmstime % \$howmany to get range 0 .. \$howmany-1

## User Input

| variable      | description             |
|---------------|-------------------------|
| %bot          | current                 |
|               | bot                     |
|               | responding              |
| %revisedinput | Boolean                 |
| -             | is                      |
|               | current                 |

## System variables

Note for all time variables, they normally use local machine time. If you have a \$cs\_utcoffset variable with a value, then all time will be relative to GMT/UTC/Zulu (which means it doesn't pay attention to daylight savings and you have to do that yourself with the answer).

%trace\_on | starting here, do :trace pattern in ^testpattern

%trace\_on all | starting here, do :trace all in ^testpattern

%trace\_off | turn off tracing (also turns off at end of cs call)

#### Build data

| variable | description                         |
|----------|-------------------------------------|
| %dict    | date/time the dictionary was built  |
| %engine  | date/time the engine was compiled   |
| %os      | os invovled (linux windows mac ios) |
| %script  | date/time build1 was compiled       |
| %version | engine version number               |

You actually can assign to any of them. This will override them and make them return what you tell them to and is a particularly BAD thing to do if this is running on a server since it affects all users (unless you reset the variable at the end of the volley. Assigning a period to a variable resets it).

Typically one does this as a temporary assignment in a #! comment line to set up conditions for testing using :verify.

Making them return a new value is NOT the same thing as making the engine have a different value. Unless the variable is marked as settable, setting a value affects only the value returned by a future call to the system variable. It does not change engine values the variable is meant to reflect.

## Control Over Input

The system can do a number of standard processing on user input, including spell correction, proper-name merging, expanding contractions etc. This is managed by setting the user variable \$cs\_token.

The default \$cs\_token that comes with Harry is:

The #signals a named constant from the dictionarySystem.h file. One can set the following:

These enable various LIVEDATA files to perform substitutions on input:

| flag                  | description                                     |
|-----------------------|---|
| #DO_ESSENTIALS        | perform LIVEDATA/systemessentials which         |
|                       | mostly strips off trailing punctuation and sets |
|                       | corresponding flags instead                     |
| #DO_SUBSTITUTES       | perform LIVEDATA/substitutes                    |
| #DO_CONTRACTIONS      | perform LIVEDATA/contractions, expanding        |
|                       | contractions                                    |
| #DO_INTERJECTIONS     | perform LIVEDATA/interjections, changing        |
|                       | phrases to interjections                        |
| #DO_BRITISH           | perform LIVEDATA/british, respelling brit words |
|                       | to American                                     |
| #DO_SPELLING          | performs the LIVEDATA/spelling file (manual     |
| _                     | spell correction)                               |
| #DO_TEXTING           | performs the LIVEDATA/texting file (expand      |
| _                     | texting notation)                               |
| #DO_SUBSTITUTE_SYSTEM | do all LIVEDATA file expansions                 |

The contents of the files above are pairs of tokens per line. Left is the word to replace and right is the replacement. When multiple words are involved, the left side uses underscores to represent this and the right side uses +. If the right side is missing, it means just delete. | #DO\_INTERJECTION\_SPLITTING | break off leading interjections into own sentence | #\$DO\_NUMBER\_MERGE | merge multiple word numbers into one (four and twenty)

 $\begin{tabular}{ll} $\mid$ \$DO_PROPERNAME\_MERGE \mid$ merge multiple proper name into one ($George Harrison$) \mid $\#DO_DATE\_MERGE \mid$ merge month day and/or year sequences ($January 2, 1993$) \mid $\#JSON\_DIRECT\_FROM\_OOB \mid$ asking the tokenizer to directly process OOB data. See $^jsonparse in JSON manual. | $\#NO\_FIX\_UTF |$ do not adjust inputs with html or utf8 encodings to simple ascii. \end{tabular}$ 

| #TOKENIZE\_BY\_CHARACTER | Every non-whitespace character becomes its own token and canonical form. (good for Japanese)

If any of the above items affect the input (except TOKENIZE\_BY\_CHARACTER), they will be echoed as values into %tokenFlags so you can detect they happened. The next changes do not echo into %tokenFlags and relate to grammar of input:

| flag                | description  |
|---------------------|--|
| DO_POSTAG           | allow pos-tagging (labels like ~noun ~verb become marked)  |
| DO_PARSE            | allow parser (labels for word roles like ~main_subject)  |
| DO_CONDITIONAL_POST | ACperform pos-tagging only if all words are known.  Avoids wasting time on foreign sentences in particular   |
| NO_CONDITIONAL_IDIO | M will not perform substitutions in the dictionary which<br>are considered conditional idioms  |
| NO_ERASE            | where a substitution would delete a word entirely as junk, don't   |
| DO_SPLIT_UNDERSCORE | S happens after all other input tokenization and adjustments except number merge, and separates words that have been conjoined either because the dictionary has them ( <i>credit_card</i> ) or because they were merged by proper name merging, or by substitution. The result is only words without underscores (excluding number words like <i>five_thousand_and_four</i> |
| MARK_LOWER          | if a word is considered a proper name in CS and is<br>marked as an upper case word, this will force it to<br>perform any markings for its lower case form as well.<br>Sometimes users type stuff in upper case that really<br>should be lower  |

Normally the system tries to outguess the user, who cannot be trusted to use correct punctuation or casing or spelling. These block that:

```

#### Note

you can change \$cs\_token on the fly and force input to be reanalyzed via `retry(SENTENCE). I do this when I detect the user is trying to give his name, and many foreign names might be spell-corrected into something wrong and the user is unlikely to misspell his own name.

Just remember to reset \$cs\_token back to normal after you are done. Here is one such way, assuming \$stdtoken is set to your normal tokenflags in your bot definition outputmacro:

If you type my name is Rogr into a topic with this, the original input is spell-corrected to my name is Roger, but this will change the \$cs\_token over to one without spell correction and redo the sentence, which will now come back with my name is Rogr and be echoed correctly, and \$cs\_token reset.

That's assuming nothing else would run differently and trap the response elsewhere. If you were worried about that, it would be possible for the script to save where it is using <code>^getrule(tag)</code> and modify your control script to return immediate control to here after input processing if you had changed <code>\$cs\_token</code>.

## %tokenflags

define IMPLIED\_SUBJECT

define QUESTIONMARK

define EXCLAMATIONMARK

define PERIODMARK

define USERINPUT

define COMMANDMARK

define IMPLIED YOU

FOREIGN\_TOKENS

FAULTY\_PARSE

**QUOTATION** 

NOT SENTENCE

One or more of these will be set if input was changed do to use of these files

```
#DO_ESSENTIALS
#DO_SUBSTITUTES
#DO_CONTRACTIONS
#DO_INTERJECTIONS
#DO_BRITISH
#DO_SPELLING
#DO_TEXTING
#DO_NOISE
#DO_PRIVATE
#DO_NUMBER_MERGE
#DO_PROPERNAME_MERGE
#DO_SPELLCHECK
#DO_INTERJECTION_SPLITTING
```

#### **Private Substitutions**

While in general, substitutions are defined in the LIVEDATA folder, you can define private substitutions for your specific bot using the scripting language. You can say

```
replace: xxx yyyyy
```

which defines a substitution just like a livedata substitution file. It actually creates a substitution file called privateO.txt or private1.txt in your TOPIC folder.

Even then, those substitutions will not be enacted unless you explicitly add to the  $cs_ten value \#DO_PRIVATE$ , eg

```
$cs_token = #D0_INTERJECTION_SPLITTING |
    #D0_SUBSTITUTE_SYSTEM |
    #D0_NUMBER_MERGE |
    #D0_PROPERNAME_MERGE |
    #D0_SPELLCHECK |
    #D0_PARSE |
    #D0_PRIVATE
```

The left side of the substitution pair is case insensitive (matches either case on input) and can be placed in double-quotes (which converts spaces to underscores internally).

The right side of the substitution pair is case sensitive and can be placed in double-quotes (which converts spaces to plus signs internally).

Note: if you privately define a substitution that leads to a known interjection, it will be treated as an interjection, marked as DO\_INTERJECTIONS rather than DO\_PRIVATE. Interjections do not perform an actual substitution, does not replace the words on the left with the interjection concept name on the right.

Instead interjections merely mark the phrase as being a member of that concept, leaving the actual words unchanged.

Similarly while canonical values of words can be defined in LIVEDATA/SYSTEM/canonical.txt, you can define private canonical values for your bots by using the scripting language. You can say:

canon: oh 0

canon: faster fast

which defines new canonical values for things and creates a file canon0.txt or canon1.txt in your TOPIC folder.

You can optionally add MORE\_FORM or MOST\_FORM as a 3rd argument, to set those flags for adjectives and adverbs.

If you want to set a canonical pair from a table during compilation, you can use a function to do the same thing (but only 1 pair at a time).

^canon(word canonicalform)

#### **Numeric Substitutions**

A special kind of private substitution (equally applicable in regular substitution files) is the numeric substitution.

replace: ?\_km kilometers

The ?\_ matches a digit number followed immediately by km, like 1.2km and will separate the number and replace the units with the given replacement. The input can be singular or have an 's' like 10.5dollars. And it can be with or without abbreviation periods, like 10kps or 10k.p.s

#### Apostrophe Substitutions replace

replace: 'xxx yyy

allows you to split during tokenization any word followed by 'xxx into two words, original sans 'xxx and yyy. eg

replace: 've have

gives "companies' ve =>"companies have".

#### Replacing to a word with + in it

Normally replace: x y+z will generate 2 words, y and z. If you need a plus in your word, you can escape your 2nd word:

replace: "black and decker"  $\BLACK+DECKER$ 

# Interchange Variables

The following variables can be defined in a script and the engine will react to their contents.

|                      | _           |
|----------------------|-------------|
| interchange variable | description |
| \$cs_token           | described   |
|                      | exten-      |
|                      | sively      |
|                      | above       |

```
interchange variable
                      {\it description}
                      controls
$cs_response
                      auto-
                      matic

### hook functions

 $cs_beforereset \mid if set to a topic, will be executed before :reset is executed \mid cs_addresponse \mid provides a function name hook onto the output q to the user. <math display="inline">\mid$ 

 $\verb§+testpatternpretopic| execute this topic to preprocess input before matchines$ 

**\$\$cs\_testpatterninput** | a copy of user input created by engine for \$testpatternpretopic to change if it wants |

 $\$  testpattern\_posttopic | can name a topic to be executed after ^testpattern to alter returned new variables |

#### variables to limit effort

 $cs_topicretrylimit \mid if defined changes how many times you can pass back RETRY_TOPIC before it fails (current limit is 30) |$ 

\$\$topic\_retry\_limit\_exceeded | set if topic retry limit is encountered |

 $cs\_userhistorylimit \mid if not null, indicates how many volleys back are tracked as what was said by both parties <math display="inline">\mid$ 

\$cs\_sentences\_limit | after this many sentences in volley, cs ignores the rest

```
(default 50) |
$cs_inputlimit | Restrict user input size (excluding oob) |
$cs_looplimit | loop() defaults to 1000 iterations before stopping. You can change this default with this |
$cs_analyzelimit | in non-standalone mode, after this millisecond limit, cs stops NL analysis of more sentences |
$cs_analyzelimitlog | if analyzelimit triggers, report this fact in bug log |
$FakeTimeOffset | For testing analyzelimit, pretend this much ms has already lapsed on start |
$cs_badspellLimit | x-y format. After x many spelling corrections or x/y ratio of badspells to words seen, stop spellchecking |
$cs_sequence | How many words in sequence to check as a composite (default: 5) |
```

#### JSON variables

```
$cs_jsontimeout | seconds before JsonOpen declares a time out failure. If
unspecified the default is 300 |
$cs_saveusedJson | if not null, the only JSON facts CS will write into the
user's topic files that are referred to (directly or indirectly) from user variables
being saved. (see below) |
$cs_proxycredentials | See ^JSONOPEN in JSON manual|
$cs_proxyserver | See ^JSONOPEN in JSON manual|
$cs_proxymethod | See ^JSONOPEN in JSON manual|
$correlation_id | See ^JSONOPEN in JSON manual|
```

## Mongo variables

```
$cs_mongoqueryparams | set as a json structure of move its fields to a mongo
query |
$mongo_enable_ssl | if set to true, will use ssl |
$mongosslcafile | data for ssl |
$mongosslpemfile | data for ssl |
$mongosslpempwd | data for ssl |
$mongovalidatessl | data for ssl |
$mongovalidatessl | data for ssl |
$mongo_timeexcess | if certain operations exceed this ms, log entry is created |
$$mongo_error | error message if db not openable |
```

Note for %trace\_on and %trace\_off - you can use the command line parameter blockapitrace to prevent tracing in any code you accidentally leave in place.

\$cs\_saveusedJson exists as a kind of garbage collection. Nowadays most facts will come from JSON data either from a website or created in script. But keeping

on top of deleting obsolete JSON may be overlooked. When this variable is non-null, ChatScript will automatically destroy any JSON fact that cannot trace a JSON fact path back to some user variable. Variables that have as values the name of a JSON object or array automatically protect all JSON facts underneath. JSON references merely within some text string will not protect anything, nor will references from some other non-JSON fact.

\$cs\_inputlimit=x:y for excessively long user input (excluding oob portion), the input will be truncated by keeping the first x characters and the last y characters.

\$cs\_crash - This topic can generate an appropriate dummy output and CS completes that volley but does not save an updated user file. The NEXT volley coming in will force cs to completely reload itself before processing. Making a dummy output hopefully means the same fatal input will not be sent back into CS to crash it again (due to external retry when no answer is received from CS). E.g.,

topic: ~crashtopic system ()
 t: Huh?

\$cs\_addresponse names a function of 2 arguments that will be called when CS wants put text into the output queue of the user. The first argument will be what CS wants to output. The second is the rule tag that generated this output. If the function returns a failure code, the message will be aborted and not put into the queue. If the function returns a text value (not null) then that message will replace what was intended to go to the user.
